

ABOUT SIGNICAT ASSURE

Signicat Assure covers the assuring and proofing of the customer's identity for online onboarding. A user-friendly and time-effective onboarding is crucial when it comes to the success rate of the process, as well as giving the business enough information to ensure trust. By using the Signicat cloud platform, service providers can offer multiple assurance methods to reach a broad number of people in multiple countries, and combine multiple proofing methods to achieve the desired level of assurance.

Mitek Strong ID

Mitek Strong ID is a cloud-based solution offering automated identity document verification with global coverage. The end-user will be asked to upload a picture of an identity document, which is then sent for verification to Signicat's service, and forwarded to Mitek for further automatic or manual checks. The service can be used as part of Signicat's Assure identity verification solution for digital onboarding, to help you efficiently and effectively onboard customers in a secure, trusted manner.

By using Signicat's platform, the merchant can offer multiple assurance methods to reach a broad number of people in multiple countries. Combining multiple proofing methods, such as identity paper scanning, live video detection, and facial recognition allows you to achieve the desired level of assurance.

Benefits for the end-user

With Signicat's implementation of Mitek Strong ID, end-users can effortlessly upload images of identity documents, such as a passport or driver's license, using a mobile or desktop device. This eliminates the need to visit a physical branch office, which takes time and effort. The experience is seamless and easily adapted to the end-user's changing needs.

Benefits for the merchant

Integration with Mitek's service through Signicat is easy for the merchant, and data retrieved during the process can be used to validate the user towards other services.

Signicat's implementation of Mitek allows the merchant to choose from two different levels of verification, Basic and Plus Auto.

Basic – automated identity document classification and data extraction	Plus Auto – additional document number algorithm and MRZ checksum validations, comparison of data from different fields in the document
